Hello,

we have dell r740 servers. What are the best power settings for Citrix hypervisor 8.1?

should we disable c states and set to high performance? Or can xenserver handle c states and allow turbo boost?

Unless you are running very old CPUs, it is not recommended to disable C-states.

Take a look at this article:

<https://support.citrix.com/article/CTX200390>

Agreed. C-state s should be left enabled in any case. See also <https://www.mycugc.org/blogs/tobias-kreidl/2019/03/07/tale-of-two-servers-bios-settings-affect-apps-gpu> and perhaps the two follow-up articles for some guidelines. You can weigh the option to set the clock speeds to be static for maximum performance or variable which will allow the ramping up r down of the individual cores as needed. There are trade-offs with both, needless to say.
